Dear Hiring Team,

I'm applying for the Software Engineer, Labeling Infrastructure position at Waymo. My recent work building AI systems that convert unstructured data into structured, auditable annotations maps directly to what this role builds at scale.

I recently engineered an AI system that replaces 3–5 day manual insurance reviews with automated 5–10 second decisions at 95%+ extraction accuracy:

- Python/FastAPI clinical NLP pipeline mapping unstructured medical text to structured FHIR resources
- MCP architecture combining patient data with policy documents for context-aware LLM reasoning
- Confidence scoring with full audit trails for downstream reviewer prioritization

Same engineering pattern as Waymo's labeling infrastructure: high-volume unstructured input → structured annotations + confidence + provenance.

Beyond that, I've shipped React/Next.js dashboards and Storybook component libraries adopted across 15+ engineering teams at NeoSOFT; coordinated a 12-service microservices migration that cut infrastructure cost 45%; and built a C++ authentication and authorization sidecar deployed across all 12 migrated services. TypeScript frontend, Python and C++ backend, production data pipelines — the stack lines up end-to-end.

I'm drawn to engineering problems where domain understanding matters as much as the code. Autonomous driving data — where every label is a downstream decision the system makes about the world — is exactly that kind of problem.

Thank you for considering my application.

Best regards,
Mihir Ravindra Adelkar
